

Tank Division

Riser Installation Instructions

Items you'll need:

Butyl Tape or Waterproof Caulk

Level

Screwdriver or Drill

STEP 1

Apply butyl tape or waterproof caulk (not included) between the underground tank and the Adapter Ring.

STEP 2

Next, using the provided screws, attach the Adapter Ring to the underground tank and ensure it is level. Add a layer of butyl tape or caulk at the connection point between the Riser and Adapter Ring.

STEP 3

Set Riser in place and secure to the Adapter Ring with provided screws. Then, apply a layer of butyl tape or caulk at the connection point between the risers.

STEP 4

Repeat riser instructions in STEP 3, until you have reached your desired height.

STEP 5

Secure lid with provided screws. The lid has a built in gasket, so NO additional butyl tape or caulk is needed.

Please Note:

Provided screws will not work with a concrete tank. If attaching risers to a concrete tank, please use concrete screws to attach Adapter Ring to tank, and 1" #8 or #10 SS machine screws to attach Riser to Adapter Ring.
